In Maine in 2003, 70 infants died before reaching their first birthday, an infant mortality rate of \_\_\_\_\_per 1,000 live births.

Between 1993 and 2003, the infant mortality rate in Maine \_\_\_\_\_by 25%.

The graph shows how age and gender influence the frequency of heart attacks in the US.

Less than 6% of all heart attacks occur in the 29-44 age group. The number of women who suffer heart attacks in this group is negligible - only \_\_\_\_\_per year, compared to \_\_\_\_\_men.

However the proportion of men and women with heart attacks \_\_\_\_\_between 45 and 64, with over half a million per year. Over 420,000 men a year in this age group have heart attacks. The incidence amongst women increases - women have one heart attack for every three men in this age group.

Over the age of 65, the number of men suffering heart attacks only \_\_\_\_\_slightly. However there is a huge increase in the number of women with heart attacks - they comprise over 40% of all victims.

In conclusion, men are more likely to be the victims of heart attacks at all ages, but women are increasingly likely over the age of 65.
